XCITY - A Decentralized Career Data Platform

A stylized graphic element consisting of two horizontal, slightly curved lines that overlap in the center, resembling a stylized 'X' or a signature.

Empowering Users with True Ownership of Career Data through Blockchain

2025/04/08

A person's hand is pointing at a laptop screen in a dimly lit room. The background is dark, and the laptop screen shows some graphical elements. The overall mood is professional and focused.

ABOUT XCITY

RWA+AI

- **X** → super
- **C**ommunity → reflects that XCITY is a decentralized professional data ecosystem
- **I**ntity → represents the user's professional identity and data ownership
- **T**rust → blockchain technology ensures data transparency and credibility
- **Y**ield → reflects the tradability and financialization of professional data

XCITY is a super community where everyone is an independent individual with their own professional data sovereignty

WHY XCITY

- Building XCITY - a decentralized career data platform based on **Solana**, dedicated to breaking down data silos, helping individuals control career data, and achieving trusted sharing and value realization
- Currently, career data is highly centralized, individuals lack control over data, and education and work experience often need to be repeatedly verified, which is not credible, and it is difficult for companies to accurately screen people
- The entire Web2 talent market lacks transparency and trust. The opportunity for Web3 lies in realizing data rights confirmation, verification, and intelligent recommendation through **NFT**, **ZKP**, and **AI**

The global recruitment market is worth more than \$500 billion

The market for professional data assetization and DeFi services is still a blue ocean

XCITY SOLUTION

- Build a Web3 open platform with career data at its core. Candidate can upload, verify, and NFT career data to achieve data ownership and autonomous control
- Enterprises can access these verified data for precise recruitment, and at the same time receive token incentives by staking data or participating in verification
- A **dual-token** economic model will be adopted. The entire system operates around XCC (Utility token) and XCG (governance token), building a closed-loop economy

TECHNOLOGY ARCHITECTURE

Blockchain

Based on the Ethereum and Layer 2 extensions (such as Solana), high-performance and low-cost transactions are achieved. Professional data cannot be tampered with, ensuring transparent and secure data storage.

AI

Data matching, mining Web3 data and analysis

ZK Proof

Verify the authenticity of user data without disclosing detailed information and protect privacy

IPFS

Use IPFS and other technologies to store resumes and big data files to reduce on-chain costs

DID

Users can manage their career data across platforms through decentralized identities (DIDs) to avoid being locked into a single platform

BUSINESS MODEL

Transaction sharing + Value-added services.

Individual user authorization data, enterprise access data, job matching, and verification services will generate XCC flow; the platform charges a handling fee

Enterprises can also pledge internal talent pool data and participate in data market transactions; XCG is used for governance and empowering early users and communities.

Market Potential +

Competitive Barriers

Compared with traditional recruitment platforms, XCITY has built a **competitive barrier** from three dimensions:

- Data rights confirmation
- Trusted sharing
- Decentralized trust network

The market of Web3 + human resources has just opened. The global human resources market is worth trillions of dollars, and XCITY, as an underlying data platform, is expected to become **an infrastructure**

Our advantage is not only the technical model, *BUT ALSO* the establishment of a **trust ecosystem**

Competitive Analysis

	XCITY	Traditional Recruitment Platform (Such as Linkedin...)
Data Ownership	User control, data tradability and revenue generation	The platform controls the user's career data, and the user has no benefits
Data Credibility	Blockchain verification, high authenticity	Lack of mandatory verification, low data authenticity, and need for repeated verification
Privacy Protection	Zero-knowledge proof and decentralized storage to protect privacy	Centralized storage, limited privacy protection
Financialization of Careers	Data staking and insurance, data has financial value	Non

We believe

XCITY is not just a recruitment platform, it is the **Web3 trust base** for professional data. In the future, the professional identity of every talent can **flow freely** on XCITY
